Fig. 6D

Fig. 6E

Synthesize entire gene in 80-mer fragments overlapping by 20 residues
at the 3' end with invariant sequences at the 5' end.

EcoRI   BbsI

80mer fragment

BsmBI   BamHI

80mer fragment

Invariant Seq.
(18 nt)
Invariant Seq.

Paired 80mer oligos are connected via PCR in a stepwise manner from 5' to 3' using
primers complimentary to the invariant seq.

80mer Fragment

5'primer   140bp PCR product   3'primer
108bp PCR fragments cloned into pGEM-T and sequenced. Clones with the proper sequence
will be cut with 2 restriction enzymes. 4 fragments will be ligated together with pcDNA3.1 in
a stepwise manner from the 5' to 3' end of gene

Fragments to be ligated with pcDNA3.1 (1-4 are in order from 5' to 3')	Restriction Enzymes Used to Cleave Fragment
Fragment 1	EcoRI/BsmBI
Fragment 2	BbsI/BsmBI
Fragment 3	BbsI/BsmBI
Fragment 4	BbsI/BamHI
pcDNA3.1	EcoRI/BamHI

Fragment 2

Fragment 1

Fragment 3

EcoRI

Fragment 4

Gene
constructed
in pcDNA3.1

BamHI
Ligations will be repeated stepwise 5' to 3' until the entire gene
has been cloned into pcDNA3.1
pCDNA3.1-env

CMV   EcoRI   BamHI

Fig. 21
Expression of subtype B consensus *env* and *gag* genes in 293T cells. Plasmids containing codon-optimized subtype B consensus *gp160, gp140,* and *gag* genes were transfected into 293T cells, and protein expression was examined by Western Blot analysis of cell lysates. 48-hours post-transfection, cell lysates were collected, total protein content determined by the BCA protein assay, and 2 μg of total protein was loaded per lane on a 4-20% SDS-PAGE gel. Proteins were transferred to a PVDF membrane and probed with serum from an HIV-1 subtype B infected individual.

Fig. 22
Co-receptor usage of subtype B consensus envelopes.
Pseudotyped particles containing the subtype B consensus gp160 Env
were incubated with DEAE-Dextran treated JC53-BL cells in the   .
presence of AMD3100 (a specific inhibitor of CXCR4), TAK779 (a
specific inhibitor of CCR5), and AMD3000+TAK779 to determine co-
receptor usage. NL4.3, an isolate known to utilize CXCR4 and YU-2,
a known CCR5-using isolate; were included as controls.

Fig. 23A
Trans complementation of env-deficient HIV-1 with codon-optimized subtype B consensus gp160 and gp140 genes.

Plasmids containing codon-optimized, subtype B consensus gp160 or gp140 genes were co-transfected into 293T cells with an HIV-1/SG3Δenv provirus. 48-hours post-transfection cell supernatants containing pseudotyped virus were harvested, clarified in a tabletop centrifuge, filtered through a 0.2μM filter, and pellet through a 20% sucrose cushion. Quantification of p24 in each virus pellet was determined using the Coulter HIV-1 p24 antigen assay; 25ng of p24 was loaded per lane on a 4-20% SDS-PAGE gel. Proteins were transferred to a PVDF membrane and probed with anti-HIV-1 antibodies from infected HIV-1 subtype B patient serum. Trans complementation with a rev-dependent NL4.3env was included for control.

Fig. 23B

Infectious Units/ng p24

BCgp160/SG3 BCgp145/SG3 Rev-NL4.3/S G3 SG3Δenv
Infectivity of virus particles containing the subtype B concensus envelope.
Infectivity of pseudotyped virus containing consensus B gp160 or gp140 was determined using the JC53-BL assay. Sucrose cushion purified virus particles were assayed by the Coulter p24 antigen assay, and 5-fold serial dilutions of each pellet were incubated with DEAE-Dextran treated JC53-BL cells. Following a 48-hour incubation period, cells were fixed and stained to visualize β-galactosidase expressing cells. Infectivity is expressed as infectious units per ng of p24.
Fig. 24B.

Neutralization of Pseudovirions containing
NL4.3 Env (gp160)

Fig. 24A
Neutralization of Pseudovirions containing Subtype B
consensus Env (gp160)

Fig. 24D

Neutralization of Pseudovirions
containing NL4.3 Env (gp160)

Fig. 24C

Neutralization of Pseudovirions containing
Subtype B consensus Env (gp160)

Neutralization sensitivity of virions containing subtype B concensus gp160 envelope.

Equivalent amounts of pseudovirions containing the subtype B consensus or NL4.3 Env (gp160) (1,500 infectious units) were preincubated with three different monoclonal neutralizing antibodies and a panel of plasma samples from HIV-1 subtype B infected individuals, and then added to the JC53-BL cell monolayer in 96-well plates. Plates were cultured for two days and luciferase activity was measured as an indicator of viral infectivity. Virus infectivity was calculated by dividing the luciferase units (LU) produced at each concentration of antibody by the LU produced by the control infection. The mean 50% inhibitory concentration (IC_{50}) and the actual % neutralization at each antibody dilution were then calculated for each virus. The results of all luciferase experiments were confirmed by direct counting of blue foci in parallel infections.
Fig. 25A
Density and p24 analysis of sucrose gradient fractions.

0.5ml fractions were collected from a 20-60% sucrose gradient. Fraction number 1 represents the most dense fraction taken from the bottom of the gradient tube. Density was measured with a refractometer and the amount of p24 in each fraction was determined by the Coulter p24 antigen assay. Fractions 6-9, 10-15, 16-21, and 22-25 were pooled together and analyzed by Western Blot. As expected, virions sedimented at a density of 1.16-1.18 g/ml.

VLPs

Non-purified

VLP production by co-transfection of subtype B consensus *gag* and *env* genes.

293T cells were co-transfected with subtype B consensus *gag* and *env* genes. Cell supernatants were harvested 48-hours post-transfection, clarified through at 20% sucrose cushion, and further purified through a 20-60% sucrose gradient. Select fractions from the gradient were pooled, added to 20ml of PBS, and centrifuged overnight at 100,000 x g. Resuspended pellets were loaded onto a 4-20% SDS-PAGE gel, proteins were transferred to a PVDF membrane, and probed with plasma from an HIV-1 subtype B infected individual.

A gp140 CFI is referred to HIV-1 envelope design with the cleavage-site-deleted (C), fusion-site-deleted (F) and gp41 immunodominant region-deleted (I) in addition to the deletion of transmembrane and cytoplasmic domains.

*Amino acid sequence underlined is the fusion domain that will be deleted in 140CF
design and the "W" underlined with red color is the last amino acid at the C
terminus, and all the remaining amino acids after the "W" will be deleted in 140CF
design.
